

A NATIONAL STRATEGY

A Safe Vote for Every American

A National Strategy for Verified, Trustworthy Elections

For the American people and the officials who serve them.

**One citizen. One verified vote. A result the whole
nation can trust —**

and not one eligible American left behind.

Every generation of Americans has been asked to protect the vote. Ours has been handed a way to do something no generation before us could: to make an election not just fair, but **provably fair** — a result every citizen can check for themselves, and a ballot no one can steal, forge, or cast twice.

This is that plan. It is simple enough to explain at a kitchen table and strong enough to satisfy an election office. It rests on one promise:

One citizen. One verified vote. A result the whole nation can trust — and not one eligible American left behind.

I. The promise

To every voter, this system promises four things in plain language:

- ✦ **Your vote is yours alone.** You hold one token — your verified key to vote. Once it is used, no one else can ever cast a vote in your name.
- ✦ **Your vote is private, forever.** No one — not a neighbor, not an official, not the government — can trace how you voted.
- ✦ **Your vote is counted, and you can prove it.** You get a receipt to confirm your ballot is in the final count.
- ✦ **The whole result can be checked by anyone.** Voters, candidates, and the press can all confirm the count is correct — no trust required.

II. How it keeps your vote safe

The heart of the system is one idea: **one person, one token, one vote.**

- ✦ Every eligible voter is given a single secure token — their verified credential to vote.
- ✦ The moment that token casts a ballot, it is spent. Any second attempt under it is refused. No double votes. No votes in a dead or stolen name.
- ✦ Identity is confirmed before the token is ever active — so every name on the list is a real, eligible person.
- ✦ Yet the token carries no identity into the ballot box, so the vote stays secret. Safety and privacy, at the same time.

III. Proving who you are — made easy

Most Americans will never lift a finger. If the rolls already know you, your token is issued automatically. If there is any question — you moved, you married, you're newly registered, a record doesn't match — clearing it is quick and painless:

- ✦ A two-minute check, in person at a verification desk or over a video call from your own home.
- ✦ A friendly official simply confirms you are a real, living person, that you are who you say, and that you belong on the roll where you live.
- ✦ A flag is a to-do, not a verdict — a quick step to switch your token on, never a mark against you.

“You shouldn't have to leave your home to prove you're you.”

So we made sure you don't have to.

IV. No eligible voter left behind

A safe election protects two things at once: it keeps out the vote that shouldn't count, and it keeps in every citizen who has the right to vote. A system that locked out grandmothers without a smartphone, or rural voters without fast internet, or a disabled neighbor the video didn't work for, would not be a safer election — it would be a smaller one, and it would fail the very people it claims to protect.

So this system is built the other way around: every path is designed so every eligible American can complete it.

- ✦ Video, in-person, and assisted verification — whatever a voter needs, there is a way through.
- ✦ If a genuine question about someone's eligibility arises, it is settled with them, person to person, with a real chance to answer — never by a faulty list quietly deleting a name.
- ✦ The goal is not to shrink the rolls. It is to make every name on them one the whole country can trust.

We do not make the electorate smaller. We make it certain — every eligible voice, verified and heard.

v. What it will never do

Trust is also built on limits. By design, this system can never:

Track how you voted

The link between you and your ballot is destroyed by mathematics.

Keep a secret file of your vote

It stores one fact: eligible, yes or no.

Purge voters by faulty lists

No automated death, felony, or citizenship match ever deletes a name; eligibility is confirmed person to person.

Leave anyone out for lacking a computer

In-person and assisted paths are always open.

vi. How America adopts it

America does not run its elections from Washington, and this plan honors that. It spreads the American way:

THE FEDERAL ROLE

Enable

Setting the standards, funding the effort, and offering model law and a shared, privacy-protected verification tool that states may choose to use.

THE STATE & LOCAL ROLE

Adopt and run

States and communities adopt and run it on their own rolls, alongside a paper record, publishing open results that build the nation's confidence one election at a time.

It is built on the standards the country already trusts — the federal guidelines that recognize verifiable, cryptographic elections — and on technology already used in real American elections.

vii. The call

A safe, verifiable election is no longer a wish. The mathematics exists. The standards exist. The will is the only missing piece — and that has always been America's to summon.

Give every eligible American a way to prove, simply and with dignity, that they are who they say — and give every American a result they can check with their own eyes. That is an election worthy of a free people.

***One citizen. One verified vote. A result the nation can trust —
and not one eligible American left behind.***

Scope note. A strategy overview for the public and for government — not legal or security advice or a statement of federal policy. Adoption is voluntary and adopter-controlled: elections in the United States are administered by states and local jurisdictions. This plan is designed so that every eligible voter can verify — not so that any eligible voter is excluded.
